## **PREDICTED CONSEQUENCES OF THE SYSTEM OF IMPORT SUBSTITUTION OF DENTAL MATERIALS IN UKRAINE**

Assessing the effect of the introduction of the import substitution system for dental materials in Ukraine is fully a difficult task, as the consequences may manifest in quantitative and qualitative changes [1]. The expected consequences and results may be the following:

- 1) expanding the range and increasing the production of dental materials in Ukraine;
- 2) creation and development of joint companies with foreign investors;
- 3) increasing the use of domestic dental materials in practice;
- 4) increase in the number of manufacturers of dental products on the territory of Ukraine;
- 5) stabilization of prices growth for dental services in the private sector;
- 6) increase in the volume of purchases of dental materials by budgetary, municipal dental medical clinics, as well as university clinics;
- 7) increasing the financial availability of dental care for the population of Ukraine by optimizing the cost of dental care in the public (municipal) sector, in the care of patients under voluntary health insurance programs, etc.;
- 8) providing opportunities to include certain dental procedures in the list of state-guaranteed package of medical care in accordance with the Law of Ukraine "On state financial guarantees of medical care" (from 19.10.2017 № 2168-VIII);
- 9) stabilization and reduction of the incidence of dental diseases in the population of the country;
- 10) increasing tolerance to domestic brands of dental materials among dental specialists;
- 11) intensification of creation processes of domestic developments in the dentistry;
- 12) creation of additional job places, increase of personnel and scientific potential of enterprises, organizations and institutions involved in the development, production and improvement of dental materials;
- 13) reducing the share of imported dental materials on the domestic dental market [2].

If we predict the quantitative and qualitative effect of the introduction of import substitution of dental materials in practice its overall impact on the health care system can be expected in the following links – increasing the rational use of available resources of the health care system (reducing the cost of dental treatment), increasing the availability of dental treatment for the population in terms of affordability (the ability to influence the cost of dental treatment as a medical service), improving the quality of medical care through the implementation of international quality standards of dental restorative materials for the treatment of teeth with hard tissue defects. The overall expected result of the system is to improve the oral health of the population of Ukraine which can affect the quality of life associated with health, bordering on the main tasks of the state in terms of meeting social needs [3,4].

With regard to the benefits for each of the subjects of such a system it is worth noting the main advantage – to increase the affordability of dental care for the population and, as a consequence, maintaining health, quality of life and general well-being. With the introduction of

such a system based on the investment and production model the advantages will be felt by the manufacturers of dental products who will be able to increase production volumes and receive additional income. The increase in the segment of domestic dental materials in the dental market will reduce the level of imports of such goods which will have a positive impact on the country's foreign economic balance and the level of exports of finished products [5,6].

Along with manufacturers of dental products, the benefits can be assessed by research institutions and higher education institutions for which will be additional opportunities for innovation and creation of scientific and technical products, research, testing and certification of dental materials, attracting additional funds, as well as – improvement of training technologies (training of dentists). Healthcare facilities will have greater opportunities to engage in innovative activities, the use of cheaper domestic dental materials will optimize the cost of dental services, expand the provision of dental care and receive additional income from the main activity. As for dentists, the implementation of such a system provides an opportunity for professional improvement and mastery of new medical and diagnostic technologies which can be a form of professional self-realization. Public and non-governmental organizations in the course of the system of import substitution of dental materials will have additional opportunities to perform their own statutory activities by engaging in the processes that will arise during the operation of import substitution. With regard to public authorities, the advantages for them can be identified assistance in the implementation of state policy in the field of health, social protection and welfare, development of science and technology and training of human resources [2,7].
